Questions that will be Addressed

- What mechanisms are available for a programmer who writes network applications?
- How to write a network application that sends packets between hosts (client and server) across an IP network?

What is Socket?

- **An interface between application and network**

The application creates a socket

The socket type dictates the **style** of communication

- **Once configured the application can**

pass data to the socket for network transmission

receive data from the socket (transmitted through the network by some other host)

Two essential types of sockets

SOCK_STREAM

TCP

reliable delivery

in-order guaranteed

connection-oriented

bidirectional

SOCK_DGRAM

UDP

unreliable delivery

no order guarantees

"no notion of "connection

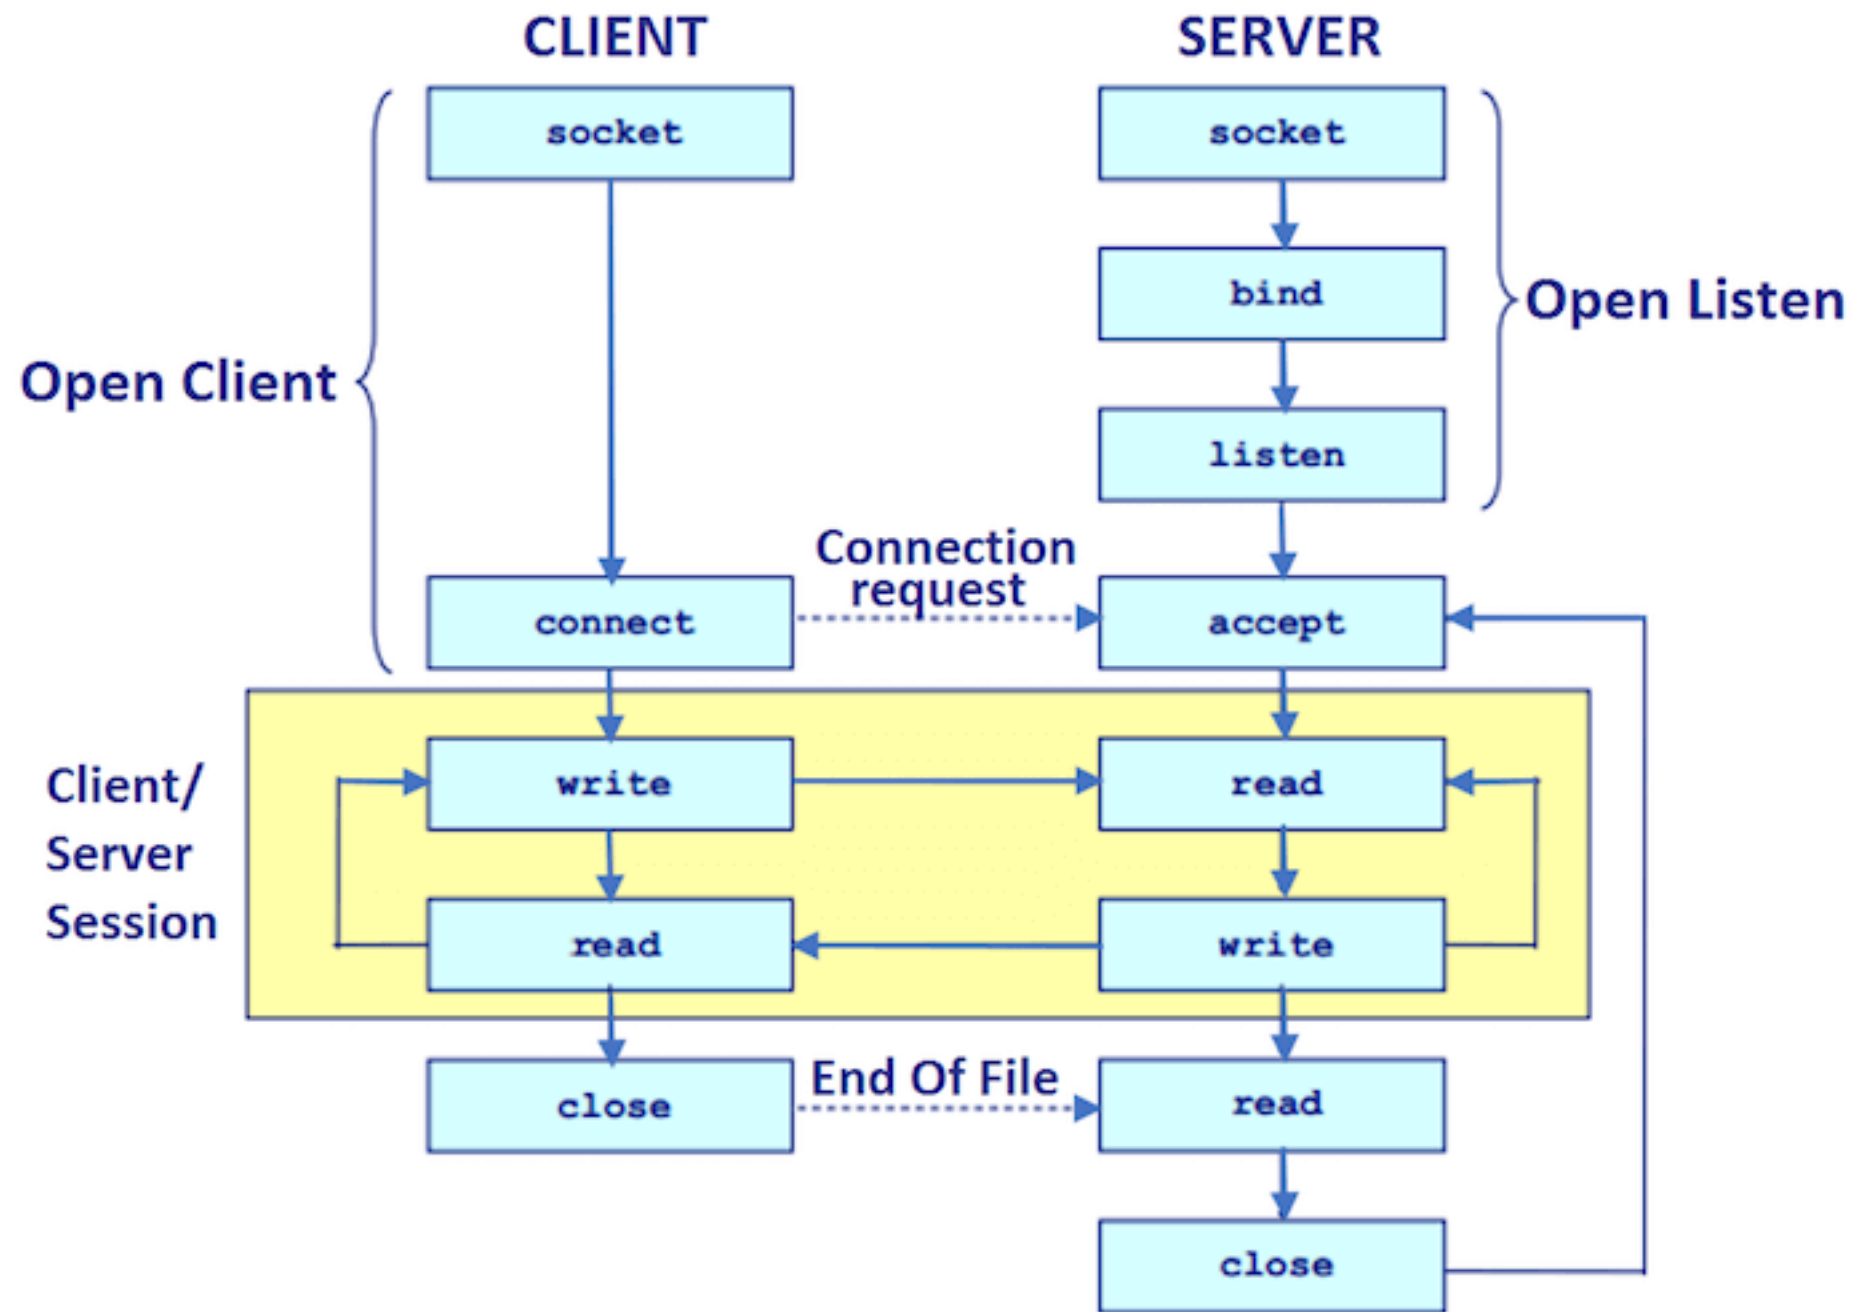

can send or receive

CLIENT SERVER ARCHITECTURE

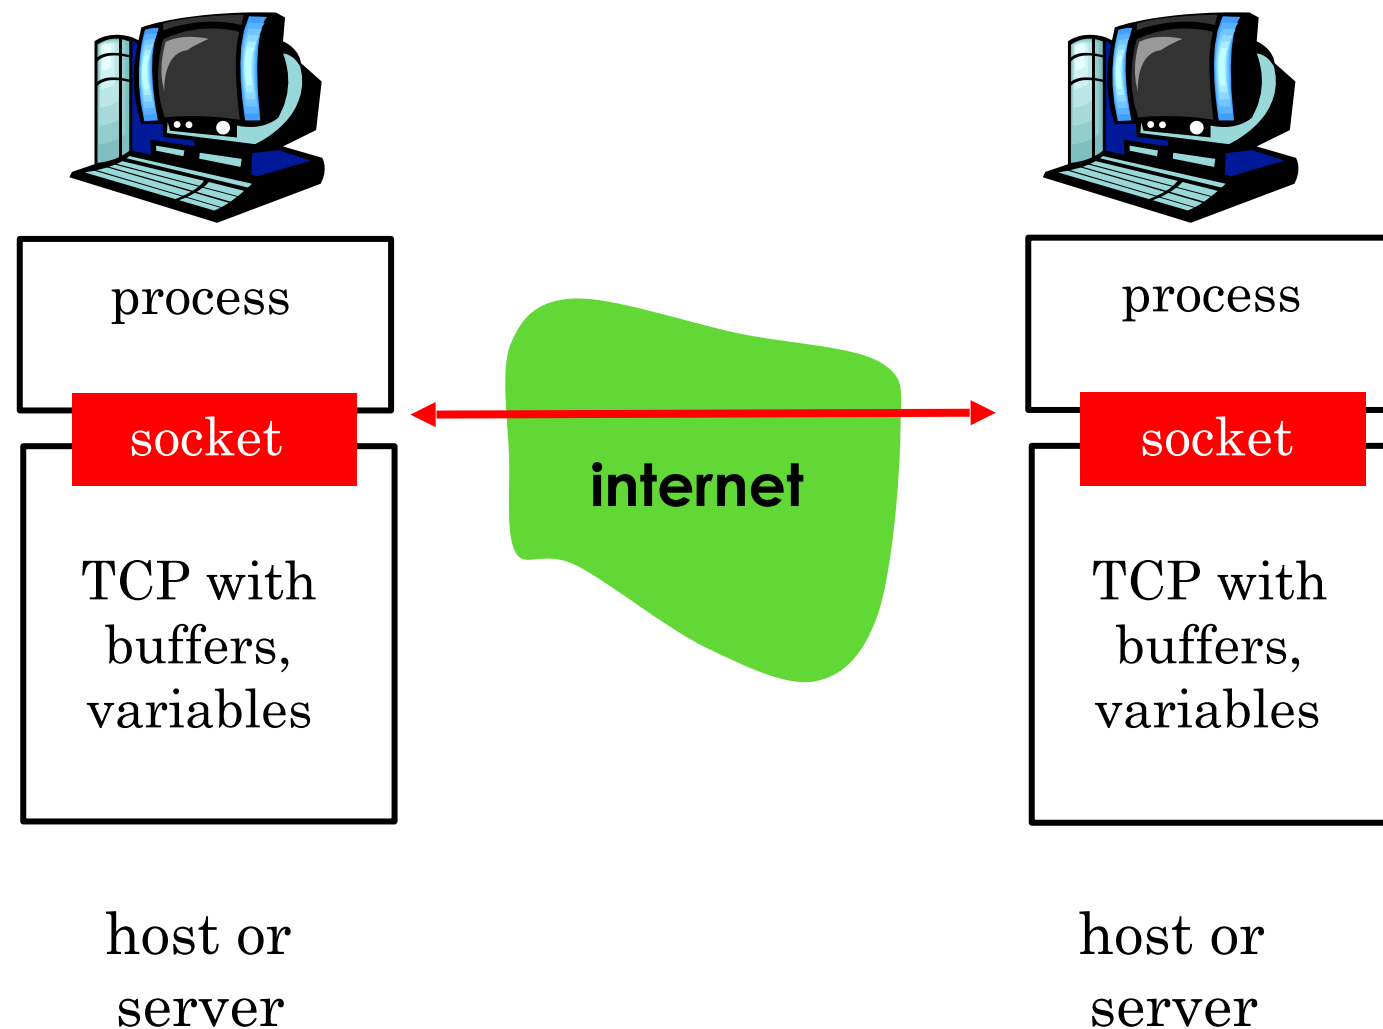

SERVER AND CLIENTS

SOCKET-PROGRAMMING USING TCP

- TCP service:
reliable transfer of **bytes** from one process to another

CLASS SERVERSOCKET - SOCKET

- **ServerSocket(int port)**

- **Methods**

- Socket accept()
- void close()

- **Socket(String host, int port)**

- **Methods**

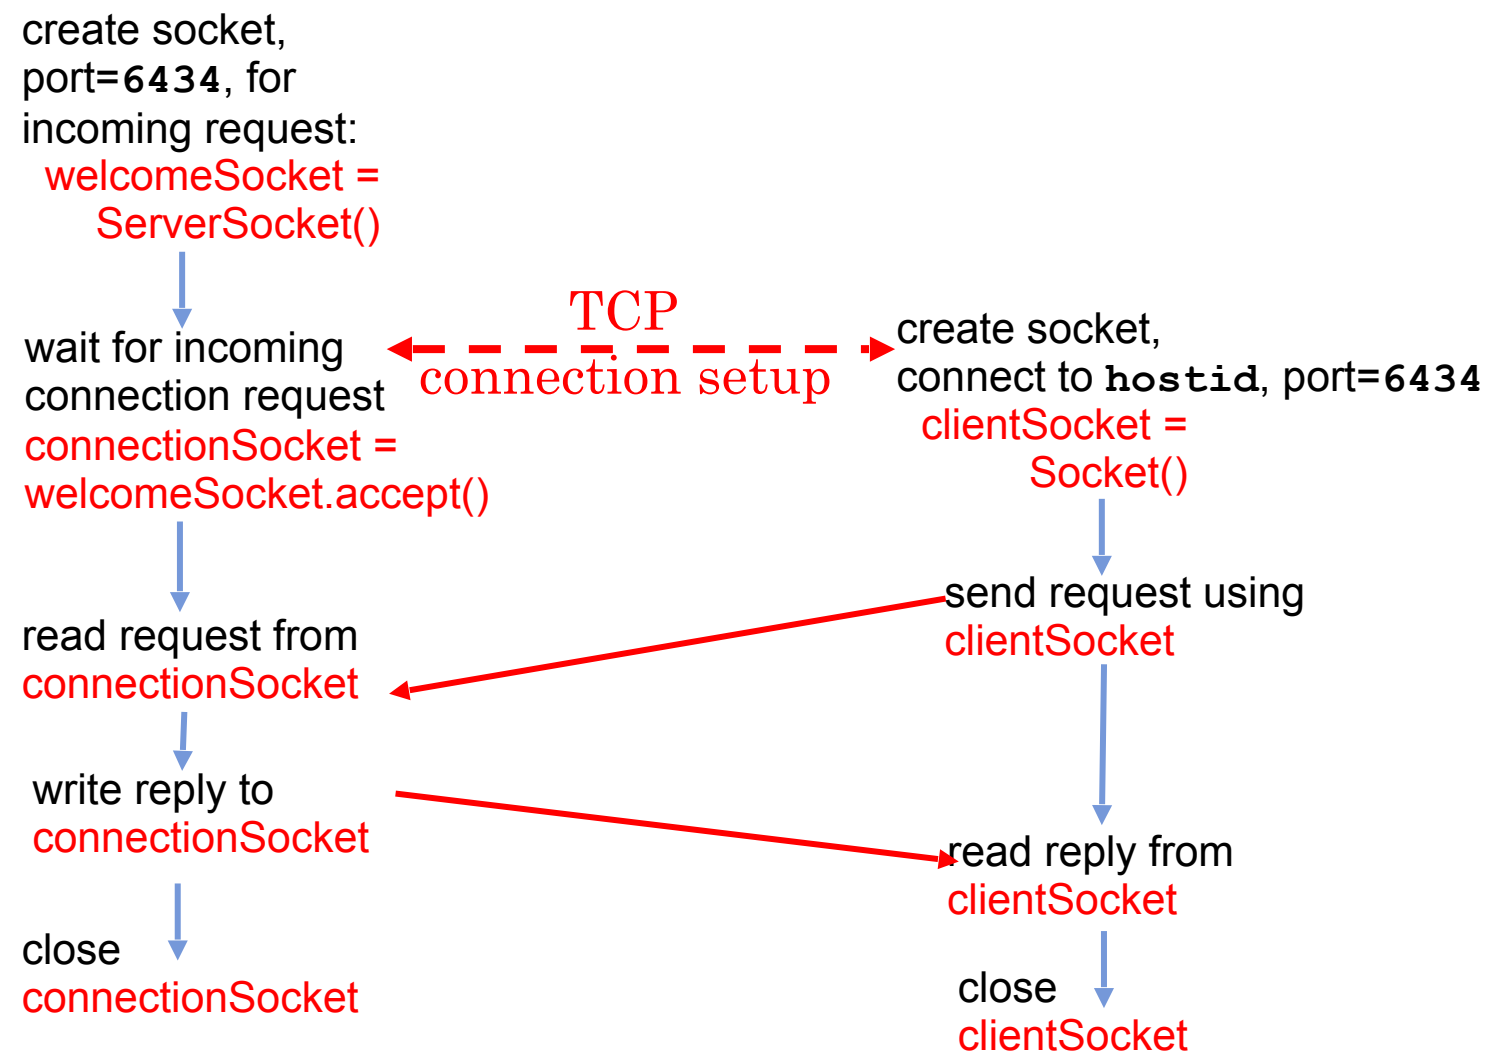

- InputStream getInputStream()
- OutputStream getOutputStream()
- InetAddress getInetAddress()
- int getPort()
- int getLocalPort()
- void close()

CLIENT/SERVER SOCKET INTERACTION: TCP

- Server (running on `hostid`)

- Client
